ABOUT

I'm Oryam Bibi Roubi, 20 — about to turn 21. I picked up Unity back in 8th grade and never really put it down; six-plus years later it's still where I go to make things real, from solo game jams to longer personal projects, handling the art direction and visual side myself the whole way.

What I'm most excited about right now is creating and exploring with AI — not just using it, but pulling it apart until I understand how it actually thinks. I split my time between building tools with AI (workflows, automation, getting agents like Claude and Claude Code to actually do useful work) and building games and art with AI — ComfyUI pipelines, Stable Diffusion, prompt engineering for consistent style, all in service of the same creative instinct that got me into Unity in the first place.

I also spent two years studying Electrical & Computer Engineering at Kinneret College — a hands-on foundation in embedded systems that still shows up in how I think about tools: I want to know what's happening under the hood, not just which button to press.

SKILLS

Unity · C# · Unity Netcode · Photon · Firebase · 3D Modeling · Blender · Stable Diffusion · ComfyUI · AI Image Generation · Prompt Engineering · Claude · Claude Code · Gemini · ChatGPT · Codex · Cursor · C++ · C · Java · Python · VHDL · FPGA (DE10-Lite) · ESP32 / Arduino · I2C · PWM · RS232 · Linux · Bash · Penetration Testing · Git

EDUCATION

Kinneret College of Engineering — 2 Years

Electrical & Computer Engineering

Two years of coursework spanning digital logic, embedded systems, and low-level programming (C/C++) alongside core electrical engineering fundamentals, including a full-scale senior engineering project.

PROJECTS

The Hell Master — Solo game jam, Unity

A small game built solo in Unity in about six hours — art, animation, and world alongside the code, all handled myself. Fast, scrappy, and shipped rather than left unfinished. Published and playable on itch.io.

oryamdev.itch.io/the-hell-master | github.com/T3co/The_Hell_Master

NPC_Mobile — Senior engineering project

A WiFi-controlled IoT robot — a full embedded system with an FPGA at the center, coordinating a live camera feed, motor control, and remote sensing through a custom Android app.

- Core controller: DE10-Lite FPGA (VHDL), routing commands to every subsystem
- Connectivity: ESP32 over WiFi for the app link, RS232 to the FPGA
- Vision: ESP32-CAM live video, object-detection driving an auto-aim laser on a servo
- Sensing & data: LM75 temperature sensor over I2C, Firebase syncing data to the app in real time
- Motor control: PWM through an L293D H-bridge driver

199 commits · C++ / Java / VHDL · 2 stars, 1 fork | github.com/T3co/NPC_Mobile

CyberSide — Game jam, 2022

A game built and shipped during a game jam held in 2022, in the middle of COVID lockdowns — as the solo dev, the art direction and visual style were entirely mine to shape, alongside the code. Published and playable on itch.io.

oryamdev.itch.io/cyberside | github.com/T3co/CyberSide — *Unity Netcode / Photon multiplayer projects aren't uploaded yet, happy to walk through the code directly. A few smaller coursework repos are on github.com/T3co.*
