SUMMARY

Software developer and game developer with 6+ years of hands-on experience building projects with Unity, C#, and modern development technologies. Started developing games independently in 8th grade and continued through personal projects, game jams, engineering coursework, and embedded systems development. Experience has expanded from game development and multiplayer systems into AI-assisted development, generative AI, automation, and agent-based workflows. Comfortable taking projects from concept through implementation and delivery, with a strong focus on understanding how technologies work under the hood.

SKILLS

Development: C# · Unity · Unity Netcode · Photon · .NET · Python · C · C++ · Java · VHDL · SQL · Git · Linux · Bash

Embedded: ESP32 · Arduino · FPGA · DE10-Lite · I2C · PWM · RS232 · Firebase

AI / Creative: Stable Diffusion · ComfyUI · AI Image Generation · Prompt Engineering · Claude · Claude Code · Gemini · ChatGPT · Codex · Cursor

Game / 3D: Multiplayer Systems · 3D Modeling · Blender

EDUCATION

Kinneret College of Engineering — Electrical & Computer Engineering · 2 Years

Coursework covering digital logic, embedded systems, low-level programming, C/C++, and core electrical engineering concepts. Completed a full-scale senior engineering project integrating FPGA, embedded hardware, networking, mobile development, computer vision, and cloud services.

PROJECTS

NPC Mobile — Senior Engineering Project

WiFi-controlled IoT robot built as a full embedded system, centered around a DE10-Lite FPGA and controlled through a custom Android application.

- Designed the core architecture around a DE10-Lite FPGA using VHDL; connected an ESP32 to the FPGA through RS232.
- Implemented ESP32-CAM live video, object detection, and an auto-aim laser mounted on a servo.
- Integrated an LM75 temperature sensor over I2C and synchronized sensor data with Firebase in real time.
- Implemented motor control using PWM and an L293D H-bridge driver; 199 commits across C++, Java, and VHDL.

The Hell Master — Solo Game Jam

Complete game developed independently in Unity in approximately six hours, from concept to playable release.

- Developed gameplay and systems in Unity/C# while independently creating art direction, visual assets, animation, and environment.
- Worked under a strict time constraint while prioritizing a complete, playable result.

CyberSide — Game Jam, 2022

Game developed and shipped independently during a 2022 game jam.

- Built the project in Unity while handling programming, art direction, and visual style independently.
- Worked within game-jam constraints to deliver a finished playable project.

Multiplayer & Networking Projects

Multiple multiplayer prototypes using Unity Netcode and Photon.

- Worked with client/server communication, player synchronization, networked gameplay, player information, usernames, lobbies, and synchronized game state.

AI & DEVELOPMENT

Build AI-assisted development workflows using Claude Code, Cursor, ChatGPT, Gemini, and Codex; experiment with AI agents for software development, automation, and workflow optimization; build generative-AI pipelines using ComfyUI and Stable Diffusion; explore prompt engineering and controlled image generation.

ADDITIONAL EXPERIENCE

Embedded & Low-Level: FPGA/VHDL, DE10-Lite, ESP32/Arduino, I2C, RS232, PWM, C/C++, Linux/Bash, and networking between embedded devices and software applications. Game Development: 6+ years of Unity development spanning solo projects, game jams, multiplayer prototypes, 3D development, networking, and emerging technologies.
